

Girls STEAM Ahead: Recoloring the Universe Training

Recoloring the Universe is an Educator Training using hands-on and virtual STEAM activities about Color, Astronomy and Coding from NASA!

Join us for this special event, as we partner with NGCP and NASA to bring you a day of exploring Girl's STEAM Ahead lessons and activities! Educators will explore "Recoloring the Universe" STEAM content and be able to bring materials back to their programs!

Students from Grades 4-12 with no prior coding experience needed can learn how to use computers to create images and understand astronomical data. Participants learn basic coding starting with familiar objects and simple concepts such as shape and color, graduating to astronomical objects.

Activities will allow participants to experience real world application of science, technology and even art. Using data from NASA's Chandra X-ray Observatory and other satellites on exploded stars, star-forming regions, and black holes, youth can learn basic coding.
